Module II

CLASSICAL VERSION OF ARTIFICIAL INTELLIGENCE

Overview

The module examines the philosophical issues arising from the development of AI. The conventional paradigm of AI views intelligence as symbolic, logical, and rule-based, influenced by rationalist and computational philosophies. However, it faces philosophical criticism for overlooking the physical, emotional, and experiential aspects of human cognition.

Objectives

- To ascertain the constraints of symbolic reasoning posited during Alan Turing's era.
- To comprehend the reasons behind the inability of early AI systems to attain genuine human-like intelligence.
- To assess the philosophical and technological issues that emerged in the classical (symbolic) methodology.
- To connect Turing's first concept of machine intelligence with the obstacles encountered by early AI research.
- To examine the shift from rule-based systems to learning-based artificial intelligence models.
- To comprehend John Searle’s critique of the Classical (Symbolic) Model of Artificial Intelligence.
- To examine the philosophical constraints of regarding computing as authentic intelligence.
- To acknowledge the ramifications of Searle’s “Chinese Room Argument” for artificial intelligence development.
- To analyse Descartes and the origins of the Philosophy of Mind.
