MODULE III

THEORIES OF KNOWLEDGE IN ARTIFICIAL INTELLIGENCE

Overview

In this module we examine the theory of knowledge, a discipline of philosophy that addresses the nature, origin, and scope of knowing. It aims to address fundamental enquiries such as "What constitutes knowledge?" "How is it acquired?" and "What differentiates a justified belief from a mere opinion?" while examining Indian and Western philosophies on epistemology and their implications for artificial intelligence

Objectives

- To delineate philosophical issues stemming from Descartes' dualism, such as the mind-body relationship.
- To comprehend the representation, processing, and utilisation of knowledge in AI systems.
- To examine philosophical theories of knowing (epistemology) and their impact on AI design.
- To investigate the manner in which AI models replicate human reasoning, learning, and comprehension.
- To assess various methodologies of knowledge: symbolic, connectionist, and statistical.
- To ascertain obstacles in the representation and use of human-like knowledge in machines.
